Sqft Living vs Price scatter plot

Median of price by grade

Insights:

- **Sqft Living and Price show a strong positive correlation** — larger homes command higher prices, though the relationship flattens above 6K sqft, suggesting diminishing returns on size alone
- **Median price rises sharply with grade** (1–13 scale), from near \$0 at grade 1 to **~\$3M at grade 13** — grade is a strong valuation proxy and likely the single best predictor in this dataset
- **Waterfront properties carry a significant price premium** — despite being the minority segment, they account for **75.68%** of combined median price value between the two groups
- **200K–600K dominates transaction volume**, while properties above 800K remain a small share — the market is concentrated in the mid-tier segment
- **Price shows a seasonal dip from September 2014 to January 2015**, recovering toward a peak in March 2015 — a pattern worth factoring into pricing or listing timing strategy
